The secret to a great garden is the quality of the soil. Soil is the plant’s home, providing the texture, structure and nutrients for root growth and sustenance. A combination of rock and mineral particles, air, water and most importantly organic matter or compost, a centimetre of soil can take many hundreds of years to form. To continue to replenish its goodness and provide the plant’s natural food source, add compost each spring and fall to your garden soil and turn it in.

HOW DOES YOUR EDIBLE GARDEN GROW?
