# COMPOST !

The soil connects us all. Not just we humans, but all life on earth.

Through plants and their roots, air that is breathed and exhaled,  
water that seeps into the soil from rain and snow,  
and the organic matter that is returned to the soil,  
living connections are made and sustained.

Twenty-five percent of the world's species live in the soil.  
They clean our water, feed the plants that feed us and calm our climate.  
Like us, they need food, water, air and shelter.

When we add compost to the soil,  
we give them what they need to keep their world and ours going.
