

A FREE Webinar Series for Gardeners

PREPARING the GROUND for HEALTHY SOIL

Webinar #4: Composting and Vermicomposting in Your Back Yard

Date: April 28th Time: 7:00 PM CST (one hour in duration)

No Fee • Advance Registration Required

In the first two webinars, we investigated the *soil food web* – the myriads of tiny creatures that live in the soil and are responsible for important soil functions such as fertility; and *soil structure*, one of the most important of the soil food web functions. In the third webinar, we looked at the important connections between healthy soils and a stable climate.

In this webinar, fourth in the series, you will learn how you can help your invisible soil workforce by providing them with a regular supply of the stuff they love best – fresh compost – made in your own back yard using your food scraps and yard/garden wastes. We will also show you how you can up your game even more by using worms (even outdoors, all year long!) to create a rich and super-nutritious garden input – worm castings.

Join us and learn how **climate-smart gardening** is the way of the future and how you can be part of that movement.

Future Free Webinars include:

Soil health, plant health & human health – connecting the dots

May 5, 7 pm CST
